

MOVES

What the product would do

1. Create a MOVE

- Date and available hours
- Starting and ending location (optional)
- Transportation mode (optional)
- Party size and budget
- Vibe (e.g. dinner and drinks or museum and picnic)

2. Invite friends

- Each participant connects their Google account.
- The app imports their relevant saved collections.
- Participants can select which lists to include.
- Users can create friend groups, whenever a plan is created, group can vote

3. Combine everyone's saved places

- Identify places saved by multiple people.
- Categorize them as restaurants, bars, cafés, museums, activities, shops, parks, and so forth.
- Remove closed businesses, duplicates, and places outside the acceptable area.

4. Generate the MOVES

- "Dinner + cocktails"
- "Museum + café + dinner"
- "Low-cost afternoon"
- "Three places everyone has saved"
- "Best route with the least travel"
- If prompted, the app can provide suggestions outside of saved places that user may like based on saved places
- Show total estimated cost for the MOVE (food/drinks/transportation)

5. Check booking requirements

- Available through an integrated reservation provider
- Bookable online, but requires the user to finish through a booking link
- Phone reservation required
- Walk-in only
- No reliable reservation information found

6. Book

- Show the proposed itinerary and reservation terms.
- User approves the complete plan.
- The app books supported venues.
- The app creates tasks or notifications for phone and walk-in venues.

7. Manage the MOVES

- Confirmation numbers

- Directions between stops
- Calendar invitations
- Live replanning when someone is late or a reservation changes
- Can make the move private or public based on if you want to allow people to join or just see what you're doing

Level 1 — Direct booking API

For approved providers:

- Check live availability
- Temporarily hold the slot
- Show deposit and cancellation terms
- Obtain explicit user approval
- Create the reservation
- Store the confirmation reference

Level 2 — Booking handoff

Where there is an online reservation page but no direct API access:

- Detect or store the correct booking provider
- Open the provider's exact restaurant/date/party-size page
- Let the user complete the transaction
- Ask the user to confirm completion or parse the resulting confirmation email with permission

Level 3 — Manual action

For phone or walk-in venues:

- Display the phone number and suggested calling script
- Create a "Call by 4 PM" task
- Notify one designated group member
- Track the reservation as pending until confirmed

MVP Capabilities

The initial product should focus on producing an excellent itinerary rather than promising universal automatic booking.

- Google account connection
- Import selected saved collections
- Multiple participants per outing
- De-duplicate and match saved places
- Date, party size, neighborhood, budget, dietary and transportation constraints
- Three ranked itinerary options
- Opening-hours validation
- Travel-time optimization
- Reservation-required detection
- Online booking links
- Phone and walk-in notifications
- Calendar itinerary
- Group voting
- One designated “booking owner”

For the first version

- One city, New York
- Restaurants, bars, cafés, museums and activities
- Two to five itinerary stops
- Walking, transit and rideshare
- Booking handoff rather than universal automatic booking

How the itinerary engine should work

This is primarily an optimization problem, not an artificial-intelligence problem.

First, score each candidate location:

None

```
Candidate score =  
  group interest  
  + number of participants who saved it  
  + category fit  
  + availability confidence  
  + opening-hours fit  
  + route efficiency  
  + ratings and quality  
  + budget fit  
  + novelty
```

Then apply hard constraints:

None

```
Venue must be open at planned arrival time  
Travel between stops must be feasible  
Reservation slot must fit the itinerary  
Total outing must end before the requested end time  
Required meal/activity categories must be represented  
Maximum travel and budget limits cannot be exceeded
```

Potential issues: Cant pull google maps saved lists, feature not available :(<https://issuetracker.google.com/issues/35820262>

Phase 2

Priority	Feature	User value
1	Beli and multi-source imports	Lets users combine restaurants saved across Beli, Google Maps, notes, social media, and other apps
2	Live reservation availability	Prevents users from choosing itineraries that cannot actually be booked
3	Automatic reservation booking	Turns the product from a planner into an execution tool
4	Group voting and ranked-choice decisions	Helps groups resolve disagreements without long message threads
5	Personalized taste profiles	Learns each user's preferred cuisine, atmosphere, price range, neighborhoods, and activities
6	Group compatibility scoring	Identifies places most likely to satisfy everyone, not merely places saved by the largest number of users

7	Dynamic itinerary replanning	Rebuilds the evening when someone is late, a venue closes, or a reservation disappears
8	Social sharing and public itineraries	Users can share “perfect date night,” “Lower East Side crawl,” or “rainy-day Brooklyn” plans
9	Creator and local-expert itineraries	Restaurants, creators, hotels, and local experts can publish curated outings
10	Post-outing feedback	Users can rate each stop and improve future recommendations
11	Automated confirmation-email ingestion	Detects reservations and adds them to the itinerary automatically
12	Phone reservation assistance	Generates a call script, reminds a group member to call, or eventually uses an AI calling agent
13	Waitlist and cancellation monitoring	Alerts users when a preferred reservation becomes available

14	Transportation integrations	Includes rideshare estimates, transit disruptions, parking, and car-service booking
15	Expense splitting	Splits deposits, tickets, shared meals, and transportation costs
16	Calendar and group-chat integrations	Syncs plans with calendars and sends updates to WhatsApp, iMessage, or Slack
17	Loyalty and rewards programs	Applies restaurant credits, membership benefits, card perks, or loyalty points
18	Weather-aware planning	Replaces outdoor stops when rain or heat makes them unsuitable
19	Accessibility and mobility filtering	Accounts for wheelchair access, walking limits, noise levels, seating, and sensory preferences
20	Business and concierge product	Hotels, assistants, event planners, and corporate teams can create itineraries for guests
